

## NOMENCLATURE REVIEW

### Writing Formulas For Binary Compounds -- "ide" compounds

For compounds containing 2 elements only. To write the formula of a binary compound (eg. aluminum oxide), use the following rules:

1. Write the symbols of the 2 elements, putting the one with the positive electrovalence first (eg. Al O)
2. Mentally mark in the valences above each element. (eg.  $\text{Al}^{+3}\text{O}^{-2}$ )
3. Use the "cross-over" rule. (eg.  $\text{Al}_2\text{O}_3$ )
4. Divide the subscripts by the highest common factor, if necessary.

Examples:

calcium nitride	$\text{Ca}_3\text{N}_2$	potassium bromide	KBr	potassium oxide	$\text{K}_2\text{O}$
aluminum carbide	$\text{Al}_4\text{C}_3$	zinc arsenide	$\text{Zn}_3\text{As}_2$	aluminum bromide	$\text{AlBr}_3$
sodium fluoride	NaF	barium iodide	$\text{BaI}_2$	calcium hydride	$\text{CaH}_2$
calcium oxide	CaO	magnesium chloride	$\text{MgCl}_2$	silicon hydride	$\text{SiH}_4$
silver sulfide	$\text{Ag}_2\text{S}$	hydrogen oxide	$\text{H}_2\text{O}$	hydrogen sulfide	$\text{H}_2\text{S}$
zinc silicide	$\text{Zn}_2\text{Si}$	silicon carbide	SiC	silver phosphide	$\text{Ag}_3\text{P}$

### Use of "ous" and "ic"

When the electropositive element has 2 valences, "ous" denote the LOWER and "ic" denotes the HIGHER valence. For example, mercury has two valences, +1 and +2. Mercurous would indicate mercury with a valence of 1 whereas mercuric would indicate mercury with a valence of 2.

Examples:

ferrous oxide	FeO	antimonous sulfide	$\text{Sb}_2\text{S}_3$
ferric oxide	$\text{Fe}_2\text{O}_3$	arsenious chloride	$\text{AsCl}_3$
phosphorous oxide	$\text{P}_2\text{O}_3$	antimonic carbide	$\text{Sb}_4\text{C}_5$
phosphoric oxide	$\text{P}_2\text{O}_5$	arsenic phosphide	$\text{As}_3\text{P}_5$
cuprous sulfide	$\text{Cu}_2\text{S}$	ferrous nitride	$\text{Fe}_3\text{N}_2$
stannous fluoride	$\text{SnF}_2$	mercuric bromide	$\text{HgBr}_2$
stannic fluoride	$\text{SnF}_4$	cupric oxide	CuO

### Use of the "Roman Numeral" System - IUPAC System

This is the preferred method for naming binary compounds. The Roman numeral represents the *valence* of the *first* element, that is the element with 2 positive electrovalences. The name of the first element is unchanged. DON'T MIX METHODS.

Examples:

iron (II) chloride	$\text{FeCl}_2$	antimony (V) sulfide	$\text{Sb}_2\text{S}_5$
--------------------	-----------------	----------------------	-------------------------

tin (IV) oxide	SnO <sub>2</sub>	arsenic (III) oxide	As <sub>2</sub> O <sub>3</sub>
phosphorous (III) iodide	PI <sub>3</sub>	mercury (I) oxide	Hg <sub>2</sub> O
copper (I) bromide	CuBr	lead (IV) nitride	Pb <sub>3</sub> N <sub>4</sub>
iron (III) chloride	FeCl <sub>3</sub>	bismuth (V) phosphide	Bi <sub>3</sub> P <sub>5</sub>

Use of the Prefixes - "mono", "di", "tri", "tetra", "penta",....

This may be used as an alternative to the 2 preceding methods. The prefix indicates *the number of atoms* of the element *to which the prefix is attached*.

eg. phosphorous (III) chloride = phosphorous trichloride = PCl<sub>3</sub>

The proper name is monophosphorous trichloride but the prefix for the first element is often omitted. Use only with carbon, sulfur and silicon.

Examples:

carbon monoxide	CO
carbon dioxide	CO <sub>2</sub>
sulfur dioxide	SO <sub>2</sub>
sulfur trioxide	SO <sub>3</sub>
carbon disulfide	CS <sub>2</sub>
silicon dioxide	SiO <sub>2</sub>
carbon tetrachloride	CCl <sub>4</sub>

Summary:

There are 3 ways of naming most binary compounds.

P<sub>2</sub>O<sub>3</sub>    phosphorous oxide  
           phosphorous (III) oxide  
           phosphorous trioxide

P<sub>2</sub>O<sub>5</sub>    phosphoric oxide  
           phosphorous (V) oxide  
           phosphorous pentoxide

Exceptions

Peroxides:        To write the formula of a peroxide, simply write the formula for the normal oxide *then add one oxygen atom*.

Examples:

sodium oxide	Na <sub>2</sub> O	sodium peroxide	Na <sub>2</sub> O <sub>2</sub>
hydrogen oxide	H <sub>2</sub> O	hydrogen peroxide	H <sub>2</sub> O <sub>2</sub>
barium oxide	BaO	barium peroxide	BaO <sub>2</sub>
lead (II) oxide	PbO	lead (II) peroxide	PbO <sub>2</sub>

Finding the Valence From the Formula

eg. find the valence of lead in  $\text{PbO}_2$

1. The valence of oxygen is -2.
2. The total valence oxygen is -4 ( $2 \times -2$ ).
3. The sum of the total valences of a compound must be 0.
4. The valence of lead is +4.

### Compounds Containing 3 Elements

#### Oxyacids and Their Salts

The 5 Main Oxyacids are:	sulphuric acid	$\text{H}_2\text{SO}_4$
	nitric acid	$\text{HNO}_3$
	carbonic acid	$\text{H}_2\text{CO}_3$
	chloric acid	$\text{HClO}_3$
	phosphoric acid	$\text{H}_3\text{PO}_4$

- Note - 1. All contain oxygen, hence the name.  
 2. All contain hydrogen - they are acids.  
 3. All end in "ic".

Many of these acids have derivative names as follows:

<i>hypochlorous acid</i>	$\text{HClO}$ - lost 2 oxygen
<i>chlorous acid</i>	$\text{HClO}_2$ - lost 1 oxygen
<b>chloric acid</b>	<b><math>\text{HClO}_3</math></b>
<i>perchloric acid</i>	$\text{HClO}_4$ - gained 1 oxygen

#### Complex Ions From the Oxyacids

A complex ion is a group of atoms that act as a unit. When the hydrogen (or part thereof) is removed from an acid, a complex ion remains.

Examples:

Acid	Complex Ion	Valence
$\text{H}_2\text{SO}_4$	$\text{SO}_4$	-2
$\text{HNO}_3$	$\text{NO}_3$	-1
$\text{H}_3\text{PO}_3$	$\text{PO}_3$	-3

#### Naming Complex ions

Acid Prefix and Suffix	Complex Ion Prefix and Suffix
hypo_____ous	hypo_____ite
_____ous	_____ite
_____ic	_____ate
per_____ic	per_____ate

Examples:

Acid	Formula	Complex Ion	Name of Complex Ion

sulfuric	H <sub>2</sub> SO <sub>4</sub>	SO <sub>4</sub>	sulfate
perchloric	HClO <sub>4</sub>	ClO <sub>4</sub>	perchlorate
chloric	HClO <sub>3</sub>	ClO <sub>3</sub>	chlorate
chlorous	HClO <sub>2</sub>	ClO <sub>2</sub>	chlorite
nitric	HNO <sub>3</sub>	NO <sub>3</sub>	nitrate
hyponitrous	HNO	NO	hyponitrite
phosphorous	H <sub>3</sub> PO <sub>3</sub>	PO <sub>3</sub>	phosphite

### Salts of the Oxyacids

eg. calcium phosphate       $\text{Ca}^{+2}\text{PO}_4^{-3} \rightarrow \text{Ca}_3(\text{PO}_4)_2$

### Examples:

calcium sulfite	CaSO <sub>3</sub>	arsenic phosphate	As <sub>3</sub> (PO <sub>4</sub> ) <sub>5</sub>
sodium chlorite	NaClO <sub>2</sub>	antimony (III) hypochlorite	Sb(ClO) <sub>3</sub>
aluminum nitrate	Al(NO <sub>3</sub> ) <sub>3</sub>	cupric nitrite	Cu(NO <sub>2</sub> ) <sub>2</sub>
ferric sulfate	Fe <sub>2</sub> (SO <sub>4</sub> ) <sub>3</sub>	mercurous perchlorate	HgClO <sub>4</sub>
zinc carbonate	ZnCO <sub>3</sub>	potassium chlorate	KClO <sub>3</sub>

### Other Complex Ions

a) ammonium complex ion (NH<sub>4</sub> valence of +1)

ammonium chloride	NH <sub>4</sub> Cl
ammonium sulphate	(NH <sub>4</sub> ) <sub>2</sub> SO <sub>4</sub>
ammonium phosphate	(NH <sub>4</sub> ) <sub>3</sub> PO <sub>4</sub>
ammonium nitrite	NH <sub>4</sub> NO <sub>2</sub>

b) hydroxide complex ion (OH valence of -1)

sodium hydroxide	NaOH
ammonium hydroxide	NH <sub>4</sub> OH
ferrous hydroxide	Fe(OH) <sub>2</sub>
copper (I) hydroxide	CuOH

c) acetate complex ion (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub> valence of -1)

calcium acetate	Ca(C <sub>2</sub> H <sub>3</sub> O <sub>2</sub> ) <sub>2</sub>
iron (III) acetate	Fe(C <sub>2</sub> H <sub>3</sub> O <sub>2</sub> ) <sub>3</sub>
tin (IV) acetate	Sn(C <sub>2</sub> H <sub>3</sub> O <sub>2</sub> ) <sub>4</sub>
ammonium acetate	NH <sub>4</sub> C <sub>2</sub> H <sub>3</sub> O <sub>2</sub>

### Binary Acids

Certain gases dissolve in water to form acids having the same formula.

Name of Gas	Formula	Name of Acid	Formula
hydrogen chloride	HCl	hydrochloric	HCl
hydrogen bromide	HBr	hydrobromic	HBr
hydrogen iodide	HI	hydroiodic	HI
hydrogen fluoride	HF	hydrofluoric	HF
hydrogen sulfide	H <sub>2</sub> S	hydrosulfuric	H <sub>2</sub> S
hydrogen cyanide	HCN	hydrocyanic	HCN

Formation of salts from these acids has been covered under binary compounds.

### Diatomic Gases

The molecules of these gaseous elements consist of pairs of identical atoms.

hydrogen gas	H <sub>2</sub>
fluorine gas	F <sub>2</sub>
chlorine gas	Cl <sub>2</sub>
bromine vapour	Br <sub>2</sub>
iodine vapour	I <sub>2</sub>
nitrogen gas	N <sub>2</sub>
oxygen gas	O <sub>2</sub>

### Hydrates

Compounds containing water of hydration.

copper sulphate pentahydrate	CuSO <sub>4</sub> *5H <sub>2</sub> O
sodium sulphate decahydrate	Na <sub>2</sub> SO <sub>4</sub> *10H <sub>2</sub> O
magnesium sulfate heptahydrate	MgSO <sub>4</sub> *7H <sub>2</sub> O

### Lesser Oxyacids

Treat these acids as chloric acid because bromine and iodine are related chemically.

bromic acid	HBrO <sub>3</sub>	iodic acid	HIO <sub>3</sub>
-------------	-------------------	------------	------------------

### Review

1. Give the name for each of the following:

a) Na<sub>3</sub>PO<sub>4</sub>

- b)  $O_2$
- c)  $Na$
- d)  $Mg(ClO_4)_2$
- e)  $HgCl_2$
- f)  $CaH_2$
- g)  $SnS_2$
- h)  $Al(OH)_3$
- i)  $ZnCO_3$
- j)  $CF_4$
- k)  $H_2SO_4$
- l)  $FeSO_3$
- m)  $AsCl_5$
- n)  $Ca(BrO_3)_2$
- o)  $HCl$
- p)  $ZnI_2$
- q)  $Na_2O_2$

2. Give the formula for each of the following:

- a) sodium carbonate
- b) tin (IV) chloride
- c) copper (I) oxide
- d) ammonium phosphate
- e) mercurous sulfate
- f) phosphorous oxide
- g) carbon dioxide
- h) cuprous chloride
- i) sulfuric oxide
- j) silver sulfide
- k) calcium nitride
- l) barium nitrite
- m) sodium nitrite
- n) ammonium perchlorate
- o) potassium hypobromite
- p) hydrosulfuric acid
- q) magnesium peroxide
